Introduction:

The aim of this white paper is to explain to the non-technical board member what can be achieved with the use of remote access technology.

Times have changed and certain technologies have become increasingly affordable, this means that working from home or from the holiday home in the south of France is no longer the remit of the super rich.

Different elements of remote working appeal to different people. Offering remote email to a director whose company hardly uses email to communicate is not likely to prove a wise decision. On the other hand equipping the same director with a Laptop that will synchronise with the office so that he can always have a copy of all his company documents with him could prove to be an absolutely amazing success. It is important to bare this in mind as you read through this document, some technologies may slot effortlessly into your organisation and solve problems you have had for years, whilst others may be the golden bullet for problems you have never had.

At the end we have a number of case studies that Gideon Squared Solutions have carried out with different organisations to give you a little more insight as to how remote access could potentially fit into your organisation.
